EXAMINER WANG, BEN C				
ART UNIT 2192		PAPER NUMBER		
MAIL DATE 04/07/2008		DELIVERY MODE PAPER		

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/805,963

**Applicant(s)**

HAYES, KENT F.

**Examiner**

BEN C. WANG

**Art Unit**

2192

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 07 January 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-40 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-40 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SE/US)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

### DETAILED ACTION

1. Applicant's amendment dated January 7, 2008, responding to the Office action mailed October 5, 2007 provided in the rejection of claims 1-40.

Examiner notices that the applicant has signed date of "January 7, 2007" of the submitted Amendment on page 16, which should be corrected as January 7, 2008.

Claims 1-40 remain pending in the application and which have been fully considered by the examiner.

Applicant's arguments with respect to claims rejection have been fully considered but are moot in view of the new grounds of rejection – see *Yook et al.* - art made of record, as applied hereto.

#### ***Claim Rejections – 35 USC § 103(a)***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-7, 9, 11-17, 19-26, 28-29, and 31-39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Klicnik et al. (Pub. No. US 2002/0184226 A1) (hereinafter 'Klicnik') in view of Liang et al. (*Bundle Dependency in Open Services*

*Gateway Initiative Framework Initialization, 2002, IEEE*) (hereinafter 'Liang') and further in view of Clohessy et al., (Pub. No. US 2003/0023661 A1) (hereinafter 'Clohessy')

3. **As to claim 1** (Previously Presented), Klicnik discloses a computer-implemented method for resolving prerequisites for native applications comprising:

- packaging a native application for a client device and corresponding dependency information within a first OSGi bundle on a server (e.g., [0010], Lines 10-16 – A bundle's manifest file identifies the bundle's contents and also the packages and services which are imported and exported by that bundle), wherein the corresponding dependency information specifies at least one prerequisite on which the native application depends for proper operation on the client device (Fig. 2; [0031], Lines 9-24; Fig. 3 – all prerequisites items; [0032]);

Although Klicnik discloses OSGi bundles ([0010]), but does not explicitly disclose resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

However, in an analogous art of *Bundle Dependency in Open Services Gateway Initiative Framework Initialization*, Liang discloses resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework (e.g., Abstract, Lines 1-11; Sec. 1 of Introduction, 1<sup>st</sup> Para., Lines 1-6; 2<sup>nd</sup> Para., Lines 1-12; Sec. of II Bundle Dependency During Framework Initialization, 1<sup>st</sup> Para., Lines 1-3; Fig. 3 – bundle dependency relationship; Sec. of IV. Conclusions and Discussions, 1<sup>st</sup> Para.,

Lines 1-2 – some of the solutions provided here are constructed from the OSGi server side).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Liang into the Klicnik's system to further resolve prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

The motivation is that it would enhance the Klicnik's system by taking, advancing and/or incorporating Liang's system which provides the framework can look up all events of those bundles to manage the bundle dependency automatically as once suggested by Liang (e.g., sec. of e) A New OSGi Component Model, 1<sup>st</sup> Para., Lines 13-16).

Klicnik and Liang do not explicitly disclose polling the client device by the server to determine if the client device has the at least one other prerequisite; obtaining the at least one prerequisite if the client device does not have the at least one prerequisite; and loading the at least one prerequisite and the native application on the client device.

However, in an analogous art of *Runtime-Resource Management*, Clohessy discloses:

- polling the client device by the server to determine if the client device has the at least one other prerequisite (e.g., Fig. 4 shows the recursive path used to resolve prerequisites, steps 104-106-108-109-110-112-104 etc. until 114 or END; [0046] – the prerequisite application component being loaded from the server to the client device);

- obtaining the at least one prerequisite if the client device does not have the at least one prerequisite (e.g., [0041] – the client device determining its available resources, and these are communicated to the server since; [0042] – the server uses this information to determine if the client has sufficient resources before downloading an application component; by identifying the available resource on the client, any limitation is also disclosed); and
- loading the at least one prerequisite and the native application on the client device (e.g., Fig. 4, elements 108 and 114 show loading the final set of OSGi bundles on the client device).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Clohessy into the Klicnik-Liang's system to further provide polling the client device by the server to determine if the client device has the at least one other prerequisite; obtaining the at least one prerequisite if the client device does not have the at least one prerequisite; and loading the at least one prerequisite and the native application on the client device in Klicnik-Liang's system.

The motivation is that it would further enhance the Klicnik-Liang's system by taking, advancing and/or incorporating Clohessy's system which offers significant advantages for improved resource management methods, systems, and products which protect runtime system resources from poorly designed or destructive application components as once suggested by Clohessy (e.g., [0006]).

4. **As to claim 2** (incorporating the rejection in claim 1) (Original), Liang discloses the method, further comprising registering the packaged native application and first OSGi bundle after the packaging step, wherein the registering step comprises storing the corresponding dependency information (e.g., Sec. 1, 1<sup>st</sup> Para., Lines 12-14 – open services include service discovery, service registration, service deployment, service processing, and service security, 2<sup>nd</sup> Para., Lines 17-19 – from a shared service registry; Sec. of d) By Using ServiceEvent and Event Handling Mechanism of OSGi, 1<sup>st</sup> Para., Lines 2-12).
5. **As to claim 3** (incorporating the rejection in claim 1) (Original), Klicnik discloses the method, wherein the polling step comprises: identifying the at least one prerequisite to the client device (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3); and Liang discloses receiving a response from the client device, wherein the response indicates whether the client device has the at least one prerequisite (e.g., Sec. of b) Modify the Bundle Management Strategy of the Framework, Lines 1-4).
6. **As to claim 4** (incorporating the rejection in claim 1) (Original), Klicnik discloses the method, further comprising: determining the at least one prerequisite, prior to the packaging step; and generating the corresponding dependency information based on the at least one prerequisite (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3).

7. **As to claim 5** (incorporating the rejection in claim 1) (Original), Klicnik discloses the method, wherein the at least one prerequisite comprises another native application (e.g., [0018], Lines 5-13).

8. **As to claim 6** (incorporating the rejection in claim 1) (Original), Liang discloses the method, wherein the at least one prerequisite is packaged with corresponding dependency information within a second OSGi bundle, and wherein the obtaining step comprises obtaining the second OSGi bundle (e.g., Fig. 3 – Bundle Dependency Relationship; Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 3<sup>rd</sup> Para.).

9. **As to claim 7** (incorporating the rejection in claim 6) (Original), Liang discloses the method, wherein loading step comprises:

- installing the first OSGi bundle and the second OSGi bundle within an OSGi environment of the client device (e.g., Sec. 1 of Introduction, 2<sup>nd</sup> Para., Lines 13—20; Sec. of Bundle Dependency During Framework Initialization, 3<sup>rd</sup> Para.);
- deploying the first OSGi bundle and the second OSGi bundle within a native environment of the client device (e.g., Sec. of Introduction, 2<sup>nd</sup> Para., Lines 1-12);  
and
- removing the native application from within the first OSGi bundle and the at least one prerequisite from within the second OSGi bundle (e.g., Sec. of c) Let The Third

Party Bundle To Manage the Service Dependency In a Centralized Control Way, 2<sup>nd</sup> Para., Lines 8-10).

10. **As to claims 9** (incorporating the rejection in claim 1) (Original), Liang discloses the method and the program product, wherein the dependency information is expressed as a package import statement (e.g., Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 3<sup>rd</sup> Para., Lines 5-11 – import-package field in its manifest file).

11. **As to claim 11** (Previously Presented), Klicnik discloses a computer-implemented method for resolving prerequisites for native applications, comprising:

- packaging a native application for a client device and corresponding dependency information within a first bundle on a server (e.g., [0010], Lines 10-16 – A bundle's manifest file identifies the bundle's contents and also the packages and services which are imported and exported by that bundle), wherein the dependency information specifies at least one prerequisite on which the native application depends for proper operation on the client device (e.g., Fig. 2; [0031], Lines 9-24; Fig. 3 – all prerequisites items; [0032]).

Although Klicnik discloses OSGI bundles (e.g., [0010]), but does not explicitly disclose resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

However, in an analogous art of *Bundle Dependency in Open Services Gateway Initiative Framework Initialization*, Liang discloses resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework (e.g., Abstract, Lines 1-11; Sec. 1 of Introduction, 1<sup>st</sup> Para., Lines 1-6; 2<sup>nd</sup> Para., Lines 1-12; Sec. of II Bundle Dependency During Framework Initialization, 1<sup>st</sup> Para., Lines 1-3; Fig. 3 – bundle dependency relationship; Sec. of IV. Conclusions and Discussions, 1<sup>st</sup> Para., Lines 1-2 – some of the solutions provided here are constructed from the OSGi server side).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Liang into the Klicnik's system to further resolve prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

The motivation is that it would enhance the Klicnik's system by taking, advancing and/or incorporating Liang's system which provides the framework can look up all events of those bundles to manage the bundle dependency automatically as once suggested by Liang (e.g., sec. of e) A New OSGi Component Model, 1<sup>st</sup> Para., Lines 13-16).

Klicnik and Liang do not explicitly disclose polling the client device to determine if the client device has the at least one other prerequisite; obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the

server; and installing the first bundle and the second bundle within an environment of the client device.

However, in an analogous art of *Runtime-Resource Management*, Clohessy discloses:

- polling the client device to determine if the client device has the at least one other prerequisite (e.g., Fig. 4 shows the recursive path used to resolve prerequisites, steps 104-106-108-109-110-112-104 etc. until 114 or END; [0046] – the prerequisite application component being loaded from the server to the client device);
- obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server (e.g., [0041] – the client device determining its available resources, and these are communicated to the server since; [0042] – the server uses this information to determine if the client has sufficient resources before downloading an application component; by identifying the available resource on the client, any limitation is also disclosed); and
- installing the first bundle and the second bundle within an environment of the client device (e.g., Fig. 4, elements 108 and 114 show loading the final set of OSGi bundles on the client device).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Clohessy into the Klicnik-Liang's system to further provide polling the client device to determine if the client device has the at least one other prerequisite; obtaining the at least one prerequisite if

Art Unit: 2192

the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server; and installing the first bundle and the second bundle within an environment of the client device in Klicnik-Liang's system.

The motivation is that it would further enhance the Klicnik-Liang's system by taking, advancing and/or incorporating Clohessy's system which offers significant advantages for improved resource management methods, systems, and products which protect runtime system resources from poorly designed or destructive application components as once suggested by Clohessy (e.g., [0006]).

12. **As to claim 12** (incorporating the rejection in claim 11) (Original), Liang discloses the method, wherein the first OSGi bundle and the second OSGi bundle are registered on the server after being packaged with the first native application and the at least one prerequisite (e.g., Sec. 1, 1<sup>st</sup> Para., Lines 12-14 – open services include service discovery, service registration, service deployment, service processing, and service security, 2<sup>nd</sup> Para., Lines 17-19 – from a shared service registry; Sec. of d) By Using ServiceEvent and Event Handling Mechanism of OSGi, 1<sup>st</sup> Para., Lines 2-12).

13. **As to claims 13-15**, please refer to claims 3-5 as set for the above accordingly.

14. **As to claim 16** (incorporating the rejection in claim 11) (Original), Liang discloses the method, further comprising:

- deploying the first OSGi bundle and the second OSGi bundle within a native environment of the client device (e.g., Sec. of Introduction, 2<sup>nd</sup> Para., Lines 1-12);  
and
- removing the native application from within the first OSGi bundle and the at least one prerequisite from within the second OSGi bundle (e.g., Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 2<sup>nd</sup> Para., Lines 8-10).

15. **As to claim 17** (incorporating the rejection in claim 11) (Original), Liang discloses the method, wherein the at least one prerequisite is packaged with corresponding dependency information within the second OSGi bundle (e.g., Fig. 3 – Bundle Dependency Relationship; Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 3<sup>rd</sup> Para.)

16. **As to claim 19** (Previously Presented), Klicnik discloses a computerized system for resolving prerequisites for native applications, comprising:

- a packaging system for packaging a native application for a client device and corresponding dependency information within a first bundle on a server (e.g., [0010], Lines 10-16 – A bundle's manifest file identifies the bundle's contents and also the packages and services which are imported and exported by that bundle), wherein the dependency information specifies at least one prerequisite on which the native

application depends for proper operation on the client device (e.g., Fig. 2; [0031], Lines 9-24; Fig. 3 – all prerequisites items; [0032]);

Although Klicnik discloses OSGI bundles (e.g., [0010]), but does not explicitly disclose resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

However, in an analogous art of *Bundle Dependency in Open Services Gateway Initiative Framework Initialization*, Liang discloses resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework (e.g., Abstract, Lines 1-11; Sec. 1 of Introduction, 1<sup>st</sup> Para., Lines 1-6; 2<sup>nd</sup> Para., Lines 1-12; Sec. of II Bundle Dependency During Framework Initialization, 1<sup>st</sup> Para., Lines 1-3; Fig. 3 – bundle dependency relationship; Sec. of IV. Conclusions and Discussions, 1<sup>st</sup> Para., Lines 1-2 – some of the solutions provided here are constructed form the OSGi server side).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Liang into the Klicnik's system to further resolve prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

The motivation is that it would enhance the Klicnik's system by taking, advancing and/or incorporating Liang's system which provides the framework can look up all events of those bundles to manage the bundle dependency automatically as once suggested by Liang (e.g., sec. of e) A New OSGi Component Model, 1<sup>st</sup> Para., Lines 13-16).

- Klicnik and Liang do not explicitly disclose a communication system for polling the client device to determine if the client device has the at least one other prerequisite; a resolution system for obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server; and a bundle loading system for loading the first bundle and the second bundle on the client device.

However, in an analogous art of *Runtime-Resource Management*, Clohessy discloses:

- a communication system for polling the client device to determine if the client device has the at least one other prerequisite (e.g., Fig. 4 shows the recursive path used to resolve prerequisites, steps 104-106-108-109-110-112-104 etc. until 114 or END; [0046] – the prerequisite application component being loaded from the server to the client device);
- a resolution system for obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server (e.g., [0041] – the client device determining its available resources, and these are communicated to the server since; [0042] – the server uses this information to determine if the client has sufficient resources before downloading an application component; by identifying the available resource on the client, any limitation is also disclosed); and

- a bundle loading system for loading the first bundle and the second bundle on the client device (e.g., Fig. 4, elements 108 and 114 show loading the final set of OSGi bundles on the client device).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Clohessy into the Klicnik-Liang's system to further provide a communication system for polling the client device to determine if the client device has the at least one other prerequisite; a resolution system for obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server; and a bundle loading system for loading the first bundle and the second bundle on the client device in Klicnik-Liang's system.

The motivation is that it would further enhance the Klicnik-Liang's system by taking, advancing and/or incorporating Clohessy's system which offers significant advantages for improved resource management methods, systems, and products which protect runtime system resources from poorly designed or destructive application components as once suggested by Clohessy (e.g., [0006]).

17. **As to claim 20** (incorporating the rejection in claim 19) (Original), Liang discloses the system, wherein packaging system further registers the first OSGi bundle after being packaged with the first native application (e.g., Sec. 1, 1<sup>st</sup> Para., Lines 12-14 – open services include service discovery, service registration, service deployment, service processing, and service security, 2<sup>nd</sup> Para., Lines 17-19 – from a shared service

registry; Sec. of d) By Using ServiceEvent and Event Handling Mechanism of OSGi, 1<sup>st</sup> Para., Lines 2-12).

18. **As to claim 21** (incorporating the rejection in claim 19) (Original), Klicnik discloses the system, wherein the communication system identifies the at least one prerequisite to the client device and receives a response from the client device that indicates whether the client device has the at least one prerequisite (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3).

19. **As to claim 22** (incorporating the rejection in claim 19) (Original), Klicnik discloses the system, further comprising: a prerequisite identification system for determining the at least one prerequisite; and an information generation system for generating the dependency information based on the at least one prerequisite (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3).

20. **As to claim 23** (incorporating the rejection in claim 19) (Original), Klicnik discloses the system, wherein the at least one prerequisite comprises another native application (e.g., [0018], Lines 5-13).

21. **As to claim 24** (incorporating the rejection in claim 19) (Original), Liang discloses the system, wherein bundle loading system comprises:

- an export system for installing the first OSGi bundle and the second OSGi bundle within the OSGi environment of the client device (e.g., Sec. 1 of Introduction, 2<sup>nd</sup> Para., Lines 13—20; Sec. of Bundle Dependency During Framework Initialization, 3<sup>rd</sup> Para.);
- a deployment system for deploying the first OSGi bundle and the second OSGi bundle within a native environment of the client device (e.g., Sec. of Introduction, 2<sup>nd</sup> Para., Lines 1-12); and
- a removal system for removing the native application from within the first OSGi bundle and the at least one prerequisite from within the second OSGi bundle (e.g., Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 2<sup>nd</sup> Para., Lines 8-10).

22. **As to claim 25** (incorporating the rejection in claim 19) (Original), Liang discloses the system, wherein the at least one prerequisite is packaged with corresponding dependency information within the second OSGi bundle (e.g., Fig. 3 – Bundle Dependency Relationship; Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 3<sup>rd</sup> Para.).

23. **As to claim 26** (incorporating the rejection in claim 19) (Original), Klicnik discloses the system, wherein the client device includes: an analysis system for determining whether the client device has the at least one prerequisite; and a response

Art Unit: 2192

system for generating and sending a response to the server (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3).

24. **As to claim 28** (incorporating the rejection in claim 27) (Original), Klicnik discloses the system, wherein the at least one prerequisite comprises another native application (e.g., [0018], Lines 5-13).

25. **As to claim 29** (incorporating the rejection in claim 19) (Previously Presented), Liang discloses the system, wherein the dependency information is expressed as a package import statement (e.g., Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 3<sup>rd</sup> Para., Lines 5-11 – import-package field in its manifest file).

26. **As to claim 31** (Currently Amended), Klicnik discloses a program product stored on a recordable medium for resolving prerequisites for native applications, which when executed, comprises:

- program code for packaging a native application for a client device and corresponding dependency information within a first bundle on a server (e.g., [0010], Lines 10-16 – A bundle's manifest file identifies the bundle's contents and also the packages and services which are imported and exported by that bundle), wherein the dependency information specifies at least one prerequisite on which the native

application depends for proper operation on the client device (e.g., Fig. 2; [0031], Lines 9-24; Fig. 3 – all prerequisites items; [0032]);

Although Klicnik discloses OSGI bundles (e.g., [0010]), but does not explicitly disclose resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

However, in an analogous art of *Bundle Dependency in Open Services Gateway Initiative Framework Initialization*, Liang discloses resolving prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework (e.g., Abstract, Lines 1-11; Sec. 1 of Introduction, 1<sup>st</sup> Para., Lines 1-6; 2<sup>nd</sup> Para., Lines 1-12; Sec. of II Bundle Dependency During Framework Initialization, 1<sup>st</sup> Para., Lines 1-3; Fig. 3 – bundle dependency relationship; Sec. of IV. Conclusions and Discussions, 1<sup>st</sup> Para., Lines 1-2 – some of the solutions provided here are constructed form the OSGi server side).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Liang into the Klicnik's system to further resolve prerequisites for native applications in an Open Service Gateway Initiative (OSGi) framework.

The motivation is that it would enhance the Klicnik's system by taking, advancing and/or incorporating Liang's system which provides the framework can look up all events of those bundles to manage the bundle dependency automatically as once suggested by Liang (e.g., sec. of e) A New OSGi Component Model, 1<sup>st</sup> Para., Lines 13-16).

- Klicnik and Liang do not explicitly disclose program code for polling the client device to determine if the client device has the at least one other prerequisite; program code for obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server; and program code for loading the first bundle and the second bundle on the client device.

However, in an analogous art of *Runtime-Resource Management*, Clohessy discloses:

- program code for polling the client device to determine if the client device has the at least one other prerequisite (e.g., Fig. 4 shows the recursive path used to resolve prerequisites, steps 104-106-108-109-110-112-104 etc. until 114 or END; [0046] – the prerequisite application component being loaded from the server to the client device);
- program code for obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server (e.g., [0041] – the client device determining its available resources, and these are communicated to the server since; [0042] – the server uses this information to determine if the client has sufficient resources before downloading an application component; by identifying the available resource on the client, any limitation is also disclosed); and

- program code for loading the first bundle and the second bundle on the client device (e.g., Fig. 4, elements 108 and 114 show loading the final set of OSGi bundles on the client device).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Clohessy into the Klicnik-Liang's system to further provide program code for polling the client device to determine if the client device has the at least one other prerequisite; program code for obtaining the at least one prerequisite if the client device does not have the at least one prerequisite, wherein the at least one prerequisite is packaged within a second bundle that is accessible to the server; and program code for loading the first bundle and the second bundle on the client device in Klicnik-Liang's system.

The motivation is that it would further enhance the Klicnik-Liang's system by taking, advancing and/or incorporating Clohessy's system which offers significant advantages for improved resource management methods, systems, and products which protect runtime system resources from poorly designed or destructive application components as once suggested by Clohessy (e.g., [0006]).

27. **As to claim 32** (incorporating the rejection in claim 31) (Original), Liang discloses the program product, wherein program code for packaging further registers the first OSGi bundle after being packaged with the first native application (e.g., Sec. 1, 1<sup>st</sup> Para., Lines 12-14 – open services include service discovery, service registration, service deployment, service processing, and service security, 2<sup>nd</sup> Para., Lines 17-19 –

from a shared service registry; Sec. of d) By Using ServiceEvent and Event Handling Mechanism of OSGi, 1<sup>st</sup> Para., Lines 2-12).

28. **As to claim 33** (incorporating the rejection in claim 31) (Original), Klicnik discloses the program product, wherein the program code for polling identifies the at least one prerequisite to the client device and receives a response from the client device that indicates whether the client device has the at least one prerequisite (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3).

29. **As to claim 34** (incorporating the rejection in claim 31) (Original), Klicnik discloses the program product, further comprising: program code for determining the at least one prerequisite; and program code for generating the dependency information based on the at least one prerequisite (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3).

30. **As to claim 35** (incorporating the rejection in claim 31) (Original), Klicnik discloses the program product, wherein the at least one prerequisite comprises another native application (e.g., [0018], Lines 5-13).

31. **As to claim 36** (incorporating the rejection in claim 31) (Original), Liang discloses the program product, further comprising:

- program code for installing the first OSGi bundle and the second OSGi bundle within an OSGi environment of the client device (e.g., Sec. 1 of Introduction, 2<sup>nd</sup> Para., Lines 13—20; Sec. of Bundle Dependency During Framework Initialization, 3<sup>rd</sup> Para.);
- program code for deploying the first OSGi bundle and the second OSGi bundle within a native environment of the client device (e.g., Sec. of Introduction, 2<sup>nd</sup> Para., Lines 1-12); and
- a removal system for removing the native application from within the first OSGi bundle and the at least one prerequisite from within the second OSGi bundle (e.g., Sec. of c) Let The Third Party Bundle To Manage the Service Dependency In a Centralized Control Way, 2<sup>nd</sup> Para., Lines 8-10).

32. **As to claim 37** (incorporating the rejection in claim 31) (Original), Klicnik discloses the program product, wherein the at least one prerequisite is packaged with corresponding dependency information within the second OSGi bundle (e.g., [0018], Lines 5-13).

33. **As to claim 38** (incorporating the rejection in claim 31) (Original), Klicnik discloses the program product, wherein the client device includes: program code for determining whether the client device has the at least one prerequisite; and program code for generating and sending a response to the server (e.g., Figs. 4A-4C; Fig. 5; [0027]; [0043], Lines 1-3).

34. **As to claim 39**, please refer to claim 9 as set forth above accordingly.

35. Claims 8 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Klicnik in view of Liang, Clohessy and in further view of Yook et al., (Pub. No. US 2004/0139177 A1) (hereinafter 'Yook' - art made of record)

36. **As to claim 8** (incorporating the rejection in claim 1) (Previously Presented), Klicnik, Liang, and Clohessy do not explicitly disclose the method wherein the method is performed recursively for the at least one prerequisite to resolve prerequisites for the at least one prerequisite.

However, in an analogous art of *System and Method for Managing Application*, Yook discloses the method wherein the method is performed recursively for the at least one prerequisite to resolve prerequisites for the at least one prerequisite (e.g., [0028] - ... a pull mode in which the application server (control device) becomes a subject of management and performs the application installation and management ...; Fig. 4 – illustrating an actual configuration of an application management system implemented in an application server pull mode; Fig. 7, steps S720 – Extract positional information on application file from controlled device and S730; [0053] through [0058]).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Yook into the Klicnik-Liang-Clohessy's system to further provide the method wherein the method is performed

recursively for the at least one prerequisite to resolve prerequisites for the at least one prerequisite in Klicnik-Liang-Clohessy system.

The motivation is that it would further enhance the Klicnik-Liang-Clohessy's system by taking, advancing and/or incorporating Yook's system which offers significant advantages that the functions of the electric home appliances can be dynamically extended in the home network environment since an application management system operable independently of the home network middleware can be implemented as once suggested by Yook (e.g., [0075]).

37. **As to claim 18** (incorporating the rejection in claim 1) (Previously Presented), please refer to claim 8 as set forth above accordingly.

38. Claims 10, 27, 30, and 40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Klicnik in view of Liang, Clohessy and in further view of Hall et al., (*Component Deployment on OSGi: The Gravity Case, January 29, 2003, Fractal Workshop – LSR-Adele*) (hereinafter 'Hall')

39. **As to claim 10** (incorporating the rejection in claim 1) (Original), although Klicnik discloses OSGi bundles (e.g., [0010]) and Liang discloses bundle dependency during framework initialization (e.g., Sec. of II), but Klicnik, Liang, and Clohessy do not explicitly disclose the method, the system, and the program product, wherein a name

and version of the native application is represented in a name and version of the OSGi bundle.

However, in an analogous art of *component deployment on OSGi: the gravity case*, Hall discloses the method, the system, and the program product, wherein a name and version of the native application is represented in a name and version of the OSGi bundle (e.g., Slide 7 – Bundle Manifest Example - Import-Package, specification-version).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Hall into the Klicnik-Liang-Clohessey's system to further provide the method, the system, and the program product, wherein a name and version of the native application is represented in a name and version of the OSGi bundle.

The motivation is that it would enhance the Klicnik-Liang- Clohessey's system by taking, advancing and/or incorporating Hall's system which provides the framework of a factory service concept built on top of OSGi and further standardizes OSGi component creation as once suggested by Hall (e.g., Slides 30-31, 35-41 – Extended OSGi Component Model for Gravity).

40. **As to claim 27** (incorporating the rejection in claim 19) (Original), although Klicnik discloses OSGi bundles (e.g., [0010]) and Liang discloses bundle dependency during framework initialization (e.g., Sec. of II), but Klicnik, Liang and Clohessey do not

explicitly disclose the system, wherein the dependency information specifies an identity and a version of the at least one prerequisite required by the native application.

However, in an analogous art of *component deployment on OSGi: the gravity case*, Hall discloses the system, wherein the dependency information specifies an identity and a version of the at least one prerequisite required by the native application (e.g., Slide 7 – Bundle Manifest Example - Import-Package, specification-version).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to combine the teachings of Hall into the Klicnik-Liang-Clohesy's system to further provide the system, wherein the dependency information specifies an identity and a version of the at least one prerequisite required by the native application.

The motivation is that it would enhance the Klicnik-Liang- Clohesy's system by taking, advancing and/or incorporating Hall's system which provides the framework of a factory service concept built on top of OSGi and further standardizes OSGi component creation as once suggested by Hall (e.g., Slides 30-31, 35-41 – Extended OSGi Component Model for Gravity).

41. **As to claim 30**, please refer to claim **10** as set forth above accordingly.

42. **As to claim 40**, please refer to claim **10** as set forth above accordingly.

***Response to Arguments***

43. Applicant's arguments filed on January 7, 2008 have been fully considered but they are not persuasive.

***In the remarks, Applicant argues that, for examples:***

- a) The cited references fail to each or suggest polling the client device by the server to determine if the client device has the at least one other prerequisite (see REMARKS on P. 13, 1<sup>st</sup> paragraph)
- b) The references cited fail to teach or suggest the loading of both a native application and any prerequisite application from server to client in an OSGi environment (see REMARKS on P. 13, 1<sup>st</sup> paragraph)
- c) The cited references fail to teach or suggest that the method for resolving prerequisites is performed recursively for the at least one prerequisite to resolve prerequisites for the at least one prerequisite (see REMARKS on P. 14, 2<sup>nd</sup> paragraph)

***Examiner's response:***

- a) Clohessy discloses that Fig. 4 shows the recursive path used to resolve prerequisites, steps 104-106-108-109-110-112-104 etc. until 114 or END; [0041] – the client device determining its available resources, and these are communicated to the

Art Unit: 2192

server since; [0042] – the server uses this information to determine if the client has sufficient resources before downloading an application component; by identifying the available resource on the client, any limitation is also disclosed; [0046] – the prerequisite application component being loaded from the server to the client device.

b) Clohessy discloses that Fig. 4, elements 108 and 114 show loading the final set of OSGi bundles on the client device.

c) Note that examiner does not rely upon Clohessy for teaching the method for resolving prerequisites is performed recursively for the at least one prerequisite to resolve prerequisites for the at least one prerequisite, rather upon Yook (art made of record) instead.

### ***Conclusion***

44. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ben C. Wang whose telephone number is 571-270-1240. The examiner can normally be reached on Monday - Friday, 8:00 a.m. - 5:00 p.m., EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tuan Q. Dam can be reached on 571-272-3695. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
